## 2.2 筛法

#### 2.2.1 线性素数筛

```
vector < bool > is Prime; // true 表示非素数 false 表示是素数
1
   vector < int > prime; // 保存素数
2
   int sieve(int n) {
3
       isPrime.resize(n + 1, false);
4
       isPrime[0] = isPrime[1] = true;
5
       for (int i = 2; i \le n; i++) {
6
7
           if (!isPrime[i]) prime.emplace_back(i);
           for (int j = 0; j < (int) prime. size () && prime [j] * i \le n; j++) {
8
                isPrime[prime[j] * i] = true;
9
10
                if (!(i % prime[j])) break;
           }
11
12
13
       return (int)prime.size();
14
```

#### 2.2.2 线性欧拉函数筛

```
bool is_prime[SIZE];
1
   int prime[SIZE], phi[SIZE]; // phi[i] 表示 i 的欧拉函数值
2
3
   int Phi(int n) { // 线性筛素数的同时线性求欧拉函数
      phi[1] = 1; is\_prime[1] = true;
4
      int p = 0;
5
      for (int i = 2; i <= n; i++) {
6
          if (!is\_prime[i]) prime[p++] = i, phi[i] = i - 1;
7
8
          for (int j = 0; j 
              is_prime[prime[j] * i] = true;
9
              if (!(i % prime[j])) {
10
                  phi[i * prime[j]] = phi[i] * prime[j];
11
12
                  break;
13
14
              phi[i * prime[j]] = phi[i] * (prime[j] - 1);
15
16
      }
17
      return p;
18
```

#### 2.2.3 线性约数个数函数筛

```
1 bool is_prime[SIZE];
```

```
int prime[SIZE], d[SIZE], num[SIZE]; // d[i] 表示 i 的因子数 num[i] 表示 i
2
      的最小质因子出现次数
   int getFactors(int n) { // 线性筛因子数
3
      d[1] = 1; is prime[1] = true;
4
      int p = 0;
5
6
       for (int i = 2; i <= n; i++) {
7
          if (!is\_prime[i]) prime[p++] = i, d[i] = 2, num[i] = 1;
8
          for (int j = 0; j

```

### 2.4 扩展欧几里得

#### 2.4.1 线性同余方程最小非负整数解

exgcd 求 ax + by = c 的最小非负整数解详解:

- 1. 求出 a,b 的最大公约数  $g = \gcd(a,b)$  , 根据裴蜀定理检查是否满足 c%g = 0 , 不满足则无解;
- 2. 调整系数 a,b,c 为  $a'=\frac{a}{a},b'=\frac{b}{a},c'=\frac{c}{a}$ , 这是因为 ax+by=c 和 a'x+b'y=c' 是完全等价的;
- 3. 实际上 exgcd 求解的方程是 a'x+b'y=1 ,求解前需要注意让系数  $a',b'\geq 0$  (举个例子,如果系数 b' 原本 <0 ,我们可以翻转 b' 的符号然后令解 (x,y) 为 (x,-y) ,但是求解的时候要把 y 翻回来);
- 4. 我们通过 exgcd 求出一组解  $(x_0, y_0)$  ,这组解满足  $a'x_0 + b'y_0 = 1$  ,为了使解合法我们需要令  $x_0 = c'x_0, y_0 = c'y_0$  ,于是有  $a'(c'x_0) + b'(c'y_0) = c''$  ;
- 5. 考虑到  $a'x_0 + b'y_0 = 1$  等价于同余方程  $a'x_0 \equiv 1 \pmod{b'}$ ,因此为了求出最小非负整数解,我们最后还需要对 b' 取模;
- 6. 最后注意特判 c'=0 的情况,如果要求解 y 且系数 b 发生了翻转,将其翻转回来。

```
long long exgcd(long long a, long long b, long long& x, long long& y) {
1
2
        if (!b) {
3
            x = 1, y = 0;
            return a;
4
5
6
        long long g = exgcd(b, a \% b, y, x);
7
        y = (a / b) * x;
8
        return g;
9
10
   11 x, y; // 最小非负整数解
11
   bool solve(11 a, 11 b, 11 c) { // ax+by=c
12
        ll g = gcd(a, b);
13
        if (c % g) return false;
14
        a \neq g, b \neq g, c \neq g;
15
        bool flag = false;
16
17
        if (b < 0) b = -b, flag = true;
        \operatorname{exgcd}(a, b, x, y);
18
        x = (x * c \% b + b) \% b;
19
```

```
20 | if (flag) b = -b;

21 | y = (c - a * x) / b;

22 | if (!c) x = y = 0; // ax+by=0

23 | return true;

24 |}
```

#### 2.4.2 一定范围内线性方程整数解数

exgcd 通解: 假设我们通过上方的 exgcd 流程获得了一组解  $(x_0, y_0)$  (没有乘 c), 那么 a'x + b'y = 1 的通解就是  $(x_0 + b't, y_0 - a't)$ , 因此 a'x + b'y = c' 的通解是  $(c'(x_0 + b't), c'(y_0 - a't))$  。

```
1
2
   * 求解 ax+by+c=0 模板CF710D
    *返回 [xl, xr] x [yl, yr] 的解数
3
    * 若至少有一组解 则x是一个合法解
4
    * 可以根据x推出y 但要注意b=0/a=0等特殊情况
5
    * 特别注意!!! 设置边界时的取整问题!!!
6
    *x/y 向上取整时(x+y-1)/y 向下取整时floor(1.0*x/y)
7
    * */
8

### 3.6 LGV 引理

一般用于有向无环图不相交路径计数 (常见于网格图)。

$$M = \begin{bmatrix} e(A_1, B_1) & e(A_1, B_2) & \cdots & e(A_1, B_n) \\ e(A_2, B_1) & e(A_2, B_2) & \cdots & e(A_2, B_n) \\ \vdots & \vdots & \ddots & \vdots \\ e(A_n, B_1) & e(A_n, B_2) & \cdots & e(A_n, B_n) \end{bmatrix} \det(M) = \sum_{S: A \to B} (-1)^{N(\sigma(S))} \prod_{i=1}^n \omega(S_i)$$

# 4 组合数学

#### 4.1 组合数预处理

```
namespace BinomialCoefficient {
1
       vector <int> fac, ifac, iv;
2
       // 组合数预处理 option=1则还会预处理线性逆元
3
       void prepare Factorials (int maximum = 1000000, int option = 0) {
4
           fac.assign(maximum + 1, 0);
5
           if a c. as sign(maximum + 1, 0);
6
7
           fac[0] = ifac[0] = 1;
           if (option) \{ // O(3n) \}
8
                iv.assign(maximum + 1, 1);
9
                for (int p = 2; p * p \le MOD; p++)
10
                    assert (MOD \% p != 0);
11
                for (int i = 2; i \le maximum; i++)
12
                    iv[i] = mul(iv[MOD\% i], (MOD - MOD / i));
13
                for (int i = 1; i \le maximum; i++) {
14
                    fac[i] = mul(i, fac[i-1]);
15
                    ifac[i] = mul(iv[i], ifac[i-1]);
16
17
           } else { // O(2n + log(MOD))
18
                for (int i = 1; i \le maximum; i++)
19
```

```
20
                          fac[i] = mul(fac[i-1], i);
                     ifac [maximum] = inv(fac [maximum]);
21
22
                     for (int i = maximum; i; i---)
                          ifac[i-1] = mul(ifac[i], i);
23
               }
24
25
          inline int binom(int n, int m) {
26
               if (n < m \mid | n < 0 \mid | m < 0) return 0;
27
               return \operatorname{mul}(\operatorname{fac}[n], \operatorname{mul}(\operatorname{ifac}[m], \operatorname{ifac}[n-m]));
28
         }
29
30
```

#### 4.2 卢卡斯定理

对于质数 p, 有:

$$\binom{n}{m} \bmod p = \binom{\lfloor n/p \rfloor}{\lfloor m/p \rfloor} \cdot \binom{n \bmod p}{m \bmod p} \bmod p$$

```
1 long long p; // C(n, m) % p
2 long long lucas(long long n, long long m) { // O(p + log(n))
3 if (m == 0) return 1;
4 return (binom(n % p, m % p) * lucas(n / p, m / p)) % p; // binom(x, y)
在线性预处理组合数之后是 O(1) 的
5 }
```

#### 4.3 小球盒子模型

设有 n 个球, k 个盒子:

- 1. 球之间互不相同,盒子之间互不相同,可以空盒根据乘法原理,答案就是  $k^n$ 。
- 2. 球之间互不相同,盒子之间互不相同,每个盒子至多装一个球相当于每个球找一个没有被选过的盒子放进去,答案是  $k^n$  ,即  $k(k-1)\cdots(k-n+1)$  。
- 3. 球之间互不相同,盒子之间互不相同,每个盒子至少装一个球可以先把盒子视为相同: n 个球放进 k 个相同盒子、不能空盒,这就是第二类斯特林数  $S_n^k$  的定义。最后由于盒子不同,再乘上一个排列数,因此答案就是  $k!S_n^k$  。
- 5. 球之间互不相同,盒子全部相同,每个盒子至多装一个球 因为盒子相同,不论怎么放都是一样的,答案是  $[n \le k]$  (这是一个布尔运算式,若  $n \le k$  成立则取 1 ,否则 0 )。

- 6. 球之间互不相同,盒子全部相同,每个盒子至少装一个球就是第二类斯特林数  $S_n^k$ 。
- 7. 球全部相同,盒子之间互不相同,可以空盒 隔板法经典应用,n+k-1 个球选 k-1 个板,因此答案是  $\binom{n+k-1}{k-1}$  。
- 8. 球全部相同,盒子之间互不相同,每个盒子至多装一个球盒子不同,相当于要选出 n 个盒子装球,因此答案是  $\binom{n}{k}$  。
- 9. 球全部相同,盒子之间互不相同,每个盒子至少装一个球隔板法经典应用,n-1 个空隙选 k-1 个插板(可以看作是情况 7 时每个盒子里都预先加入一个球),因此答案是  $\binom{n-1}{k-1}$  。
- 10. 球全部相同, 盒子全部相同, 可以空盒

定义划分数  $p_{n,k}$  表示将自然数 n 拆成 k 份的方案数,那么本例的结论就是  $p_{n,k}$ 。

这个问题有一个经典递推式: p(n,k) = p(n,k-1) + p(n-k,k)。 意义是将 j 个自然数 +1 或者加入一个 0。下面给出一个代码实现:

```
|p[0][0] = 1;
1
2
   for (int i = 1; i \le n; i++) {
3
       p[0][i] = 1;
       for (int j = 1; j \le m; j++) {
4
5
            if (i >= j) 
                p[i][j] = add(p[i][j-1], p[i-j][j]);
6
7
            } else {
               p[i][j] = p[i][j-1];
8
9
       }
10
11
```

- 11. 球全部相同,盒子全部相同,每个盒子至多装一个球和情况 5 一致,就是  $[n \le k]$  。
- 12. 球全部相同,盒子全部相同,每个盒子至少装一个球显然也是一个划分数:  $p_{n-k,k}$ 。

### 4.4 斯特林数

#### 4.4.1 第一类斯特林数

第一类斯特林数  $\begin{bmatrix} n \\ k \end{bmatrix}$  表示将 n 个不同元素划分入 k 个非空圆排列的方案数。

边界是 
$$\begin{bmatrix} 0 \\ 0 \end{bmatrix} = 1$$
 。

第一类斯特林数三角形,从 s(1,1) 开始:

# 4.4.2 第二类斯特林数

第二类斯特林数  $\binom{n}{k}$  表示将 n 个不同元素划分为 k 个非空子集的方案数。

$${n \brace k} = {n-1 \brace k-1} + k {n-1 \brack k}$$

边界是 
$$\begin{cases} 0 \\ 0 \end{cases} = 1$$
 。

基于容斥原理的递推方法:

$${n \brace k} = \frac{1}{k!} \sum_{i=0}^{k} (-1)^{i} {k \choose i} (k-i)^{n}$$

第二类斯特林数三角形,从 S(1,1) 开始:

# 5 博弈论

### 5.1 SG 定理

一个状态的 SG 函数值是它所有后继状态的 MEX,当 MEX 为 0 时该状态后手必胜,反之先手必胜。当某个游戏由多个独立的子游戏组成时,所有子游戏的 SG 函数异或和为 0 时后手必胜,否则先手必胜。

在 Nim 博弈中的简单应用:显然第 i 堆石子的 SG 函数值就是它的石子数量  $a_i$ ,每一堆石子都是一个独立的子游戏,因此  $a_0 \oplus a_1 \oplus \cdots a_{n-1} = 0$  时后手必胜,否则先手必胜。

# 5.2 Bash 博弈

一共 N 个石子,先后手轮流取石子,每次最多取 M 个石子,先取完者获胜。 先手必胜:  $N \pmod{M+1} \neq 0$ ; 必败:  $N \pmod{(M+1)} = 0$ 。

#### 5.3 Nim-K 博弈

有 N 堆石子,先后手轮流取石子,每次最多可以选择 K 堆石子,被选中的每堆石子都可以取任意个, 先取完者获胜。

把 N 堆石子的石子数量都用二进制表示,对于二进制意义下的每一位,如果 1 的数量在模 K+1 意义下全部为 0 ,则先手必败。

# 5.4 Anti-Nim 博弈

规则和 Nim 博弈一致,但是获胜条件改为:不能取石子的一方获胜。满足以下任意条件,则先手必胜:

- 1. 所有堆的石子数量  $\leq 1$  并且异或和 = 0 。
- 2. 至少存在一堆石子个数  $\geq 2$  并且异或和  $\neq 0$ 。

#### 5.5 Anti-SG 博弈

SG 博弈中最先不能行动的一方获胜。满足以下任意条件,则先手必胜:

- 1. SG 为 0 并且每一个游戏的 SG 都不超过 1。
- 2. SG 不为 0 并且至少有一个游戏的 SG 大于 1。

# 5.6 阶梯博弈

有 N 个阶梯(下标从 0 开始),每个阶梯上有一定数量的石子,先后手轮流行动,每次可以从一个阶梯上拿走任意个石子放到下一层阶梯上,最先不能操作者失败。

SG 函数为奇数阶梯上的石子的异或和,如果移动偶数层的石子到奇数层,对手一定可以继续移动这些石子到偶数层使得 SG 不变。

### 5.7 Wythoff 博弈

有两堆石子,石子数量分别为 A,B ,每次可以从一堆或者两堆里拿走**相同数量**的石子,最先不能取石子的人输。

必败态为:  $A_k = \lfloor \frac{k(1+\sqrt{5})}{2} \rfloor, B_k = a_k + k$ ,假设  $A_k < B_k$ 。

### 5.8 树上删边博弈

给定一棵 N 个点的有根树,两人轮流操作,每次删除树上的一条边,然后删除所有不与根节点联通的部分,最先不能进行删除操作的人失败。

所有叶子节点的 SG 函数值为 0 , 非叶子节点的 SG 值为其所有子节点(SG 值 +1)的异或和。

# 5.9 无向图删边博弈

和树上删边博弈的规则一样,不过给出的是一个无向图。

可以将图中的任意一个偶环缩成一个新点,任意一个奇环缩成一个新点加一个新边; 所有连到原先环 上的边全部改为与新点相连。

# 5.10 二分图博弈

给出一张二分图和起点 S ,先后手轮流操作,每次只能从当前点(最开始是点 S)移动到一个**相邻**的点,且每个点只能被**遍历一次**,无法继续移动的人输。

先手必胜:二分图的最大匹配一定包含起点 S; 先手必败:二分图的最大匹配不一定包含起点 S。

# 6 图论

#### 6.1 并查集

```
struct dsu {
 1
 2
   private:
       // number of nodes
 3
       int n;
4
5
       // root node: -1 * component size
 6
        // otherwise: parent
7
       std::vector<int> pa;
8
   public:
       dsu(int n_{=} = 0) : n(n_{=}), pa(n_{=}, -1)  {}
9
       // find node x's parent
10
       int find(int x) {
11
            return pa[x] < 0 ? x : pa[x] = find(pa[x]);
12
13
        // merge node x and node y
14
        // if x and y had already in the same component, return false, otherwise
15
            return true
        // Implement (union by size) + (path compression)
16
       bool unite(int x, int y) {
17
            int xr = find(x), yr = find(y);
18
            if (xr != yr) {
19
20
                if (-pa[xr] < -pa[yr]) std::swap(xr, yr);
                pa[xr] += pa[yr];
21
                pa[yr] = xr; // y \rightarrow x
22
23
                return true;
24
            return false;
25
26
        // size of the connected component that contains the vertex x
27
       int size(int x) {
28
```

```
29 | return -pa[find(x)];
30 | }
31 |};
```

### 6.2 最短路

```
namespace Dijkstra {
1
2
   #define ll long long

# 6.10 上下界网络流

# 6.10.1 无源汇上下界可行流

给定无源汇流量网络 G。询问是否存在一种标定每条边流量的方式,使得每条边流量满足上下界同时每一个点流量平衡。

不妨假设每条边已经流了 b(u,v) 的流量,设其为初始流。同时我们在新图中加入 u 连向 v 的流量为 c(u,v)-b(u,v) 的边。考虑在新图上进行调整。

由于最大流需要满足初始流量平衡条件(最大流可以看成是下界为 0 的上下界最大流),但是构造出来的初始流很有可能不满足初始流量平衡。假设一个点初始流入流量减初始流出流量为 M。

若 M=0, 此时流量平衡, 不需要附加边。

若 M > 0,此时入流量过大,需要新建附加源点 S',S' 向其连流量为 M 的附加边。

若 M < 0,此时出流量过大,需要新建附加汇点 T',其向 T' 连流量为 -M 的附加边。

如果附加边满流,说明这一个点的流量平衡条件可以满足,否则这个点的流量平衡条件不满足。(因为原图加上附加流之后才会满足原图中的流量平衡。)

在建图完毕之后跑 S' 到 T' 的最大流,若 S' 连出去的边全部满流,则存在可行流,否则不存在。

### 6.10.2 有源汇上下界可行流

给定有源汇流量网络 G。询问是否存在一种标定每条边流量的方式,使得每条边流量满足上下界同时除了源点和汇点每一个点流量平衡。

假设源点为 S, 汇点为 T。

则我们可以加入一条 T 到 S 的上界为  $\infty$ ,下界为 0 的边转化为无源汇上下界可行流问题。

若有解,则 S 到 T 的可行流流量等于 T 到 S 的附加边的流量。

#### 6.10.3 有源汇上下界最大流

给定有源汇流量网络 *G*。询问是否存在一种标定每条边流量的方式,使得每条边流量满足上下界同时除了源点和汇点每一个点流量平衡。如果存在,询问满足标定的最大流量。

我们找到网络上的任意一个可行流。如果找不到解就可以直接结束。

否则我们考虑删去所有附加边之后的残量网络并且在网络上进行调整。

我们在残量网络上再跑一次 S 到 T 的最大流,将可行流流量和最大流流量相加即为答案。

一个非常易错的问题: S 到 T 的最大流直接在跑完有源汇上下界可行的残量网络上跑。

#### 6.10.4 有源汇上下界最小流

给定有源汇流量网络 G。询问是否存在一种标定每条边流量的方式,使得每条边流量满足上下界同时除了源点和汇点每一个点流量平衡。如果存在,询问满足标定的最小流量。

类似的, 我们考虑将残量网络中不需要的流退掉。

我们找到网络上的任意一个可行流。如果找不到解就可以直接结束。

否则我们考虑删去所有附加边之后的残量网络。

我们在残量网络上再跑一次 T 到 S 的最大流,将可行流流量减去最大流流量即为答案。

对于每个点,向 T 连边权 c,上界  $\infty$ ,下界为 1。

S 点为 1 号节点。

跑一次上下界带源汇最小费用可行流即可。

因为最小费用可行流解法与最小可行流类似,这里不再展开。

#### 6.11 全局最小割

```
1 constexpr int N = 601;

# 10 数学公式及定理

## 10.1 求导法则

下文中 f,g 代表可微函数,其余字符代表常数。

- 1. 加法法则:  $(af)' = a \cdot f'$
- 2. 乘法法则: (fg)' = gf' + fg'
- 3. 除法法则:  $(\frac{f}{g})' = \frac{gf' fg'}{g^2}$
- 4. 链式法则:  $(f \circ g)' = f'(g(x))g'(x)$

# 10.2 麦克劳林级数

$$\frac{1}{1-x} = 1 + x + x^2 + \dots = \sum_{n=0}^{\infty} x^n$$

$$\frac{1}{1+x} = 1 - x + x^2 - \dots = \sum_{n=0}^{\infty} (-1)^n x^n$$

$$e^x = 1 + x + \frac{x^2}{2!} + \dots = \sum_{n=0}^{\infty} \frac{x^n}{n!}$$

$$\sin(x) = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots = \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n+1}}{(2n+1)!}$$

$$\cos(x) = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots = \sum_{n=0}^{\infty} (-1)^n \frac{x^{2n}}{(2n)!}$$

$$\ln(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \dots = \sum_{n=1}^{\infty} (-1)^{n-1} \frac{x^n}{n!}$$

$$(1+x)^p = \sum_{k=0}^{\infty} \frac{p(p-1) \dots (p-k+1)}{k!} x^k$$

# 10.3 泰勒公式

$$f(x) = \sum_{n=0}^{\infty} \frac{f^{(n)}(x_0)}{n!} (x - x_0)^n$$

## 10.4 微积分

#### 10.5 球缺

以下公式中H为球缺的高,R为大圆半径。

球缺质心: 匀质球缺的质心位于它的中轴线上,并且与底面的距离为:

$$c = \frac{(4R - H)H}{12R - 4H}$$

球缺的体积:

$$V = \pi H^2 (R - \frac{H}{3})$$

球冠的表面积公式:

$$S = 2\pi RH$$

## 10.6 圆环整点数

 $x^2+y^2=n$  整数解数:将 n 分解为  $2^x\prod p_i^{c_i}\prod q_i^{d_i}$ ,其中  $p_i$  为形如 4k+1 的质因子, $q_i$  为 4k+3 的质因子,解的总数为  $4\prod (c_i+1)$  。

## 10.7 吸收型马尔可夫链

### 10.7.1 规范型转移矩阵

两个主要定义:

- 1. 吸收态: 从当前状态只能转移到自身的状态,即转移矩阵中  $p_{i,i}=1$ 。
- 2. 瞬态: 非吸收态的所有状态称为瞬态。

让所有瞬态位于左侧,吸收态位于右侧,即  $S = \{s_1, s_2, \ldots, s_k, s'_{k+1}, \ldots, a'_r\}$  ,其中  $s_i$  表示瞬态, $s'_j$  表示吸收态,假设瞬态集合大小为 k 。此时,转移矩阵就可以写成:

$$\begin{bmatrix} \mathbf{Q} & \mathbf{R} \\ \mathbf{0} & \mathbf{I} \end{bmatrix}$$

这里, I 是一个单位矩阵,  $\mathbf{0}$  是一个零矩阵,  $\mathbf{Q}$  是一个  $k \times k$  的非零矩阵,  $\mathbf{R}$  是一个  $k \times (r-k)$  的非零矩阵。这个转移矩阵被称为规范型转移矩阵,简称规范矩阵(Canonical Matrix)。

## 10.7.2 基本矩阵

对于一个吸收型马尔可夫链,如果矩阵  $\mathbf{I}-\mathbf{Q}$  存在一个逆矩阵  $\mathbf{N}$  ,那么矩阵  $\mathbf{N}$  的第 i,j 项  $n_{i,j}$  就是从  $s_i$  移动到  $s_j$  的期望步数。

# 10.7.3 吸收时间

令  $\mathbf{t}$  为一个  $1 \times r$  的行向量, 其中  $t_i$  表示从状态  $s_i$  出发被吸收的期望步数, 那么有:

$$\mathbf{t} = \mathbf{N}\mathbf{c}$$

其中  $\mathbf{c}$  是一个  $r \times 1$  的全 1 列向量。

更具体地,从瞬态  $s_i$  出发被任意吸收态  $s_i'$  吸收的期望时间构成一个  $r-k\times r-k$  的矩阵  ${\bf E}$  ,且有:

$$\mathbf{E} = \frac{\mathbf{N}^2 \mathbf{R}}{\mathbf{N} \mathbf{R}}$$

这里的除法就是两个矩阵之间的对应元素直接相除,而不是矩阵求逆。

## 10.7.4 吸收概率

令  $b_{i,j}$  表示从瞬态  $s_i$  出发在  $s_j$  被吸收的概率,那么  $\mathbf{B}$  是一个  $k \times r$  的矩阵,且有:

$$B = NR$$

其中,  $\mathbf{R}$  就是标准型转移矩阵中的  $\mathbf{R}$  。
